

2019 Water Quality Report – Cascadia Water

Water System Name: TEL Company #1 – Dept of Health System ID 030995

The 2019 Annual Water Quality Report (Consumer Confidence Report) is a requirement of your water system by the Environmental Protection Agency (EPA) to inform you of the water services (details about where your water comes from, what it contains, and how it compares to standards set by regulatory agencies) that have been provided to you over the past year by the system.

Is the water safe for everyone?

All drinking water, including bottled drinking water, may be reasonably expected to contain at least a small amount of some constituents. It is important to remember that the presence of these does not necessarily pose a health risk. Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/Centers for Disease Control guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline: 800-426-4791.

Why are there contaminants in my drinking water?

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity:

- microbial contaminants, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban stormwater runoff, industrial, or domestic wastewater discharges, oil and gas production, mining, or farming; pesticides and herbicides, which may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.
- organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, and septic systems.
- radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, the WA Department of Health and EPA prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. We are pleased to report that Cascadia Water met all the federal and state drinking water standards last year for your system.

Additional Information for Lead

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Cascadia Water is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at <http://www.epa.gov/safewater/lead>. Our next routine lead & copper sampling will take place July/August 2020. If you'd like to sign up for your home to be a sample location, please contact us to let us know!

Public meeting opportunities:

We do not have any regularly scheduled public meetings for your system. When a public meeting is scheduled in the future, we will send out notices and update our website with that information to give you advanced notice.

If you have any questions about this report, the water test results or concerning your water utility, please call (360) 331-7388 and ask for the general manager Culley Lehman.

2019 Water Quality Report – Cascadia Water

Water System Name: TEL Company #1 – Dept of Health System ID 030995

Where Does Our Water Come From?

TEL Company #1 serves water to customers along Coles Rd (Inglewood Dr / Overlook Dr / Nighthawk Rd / Sunridge Rd / Davie Ln / Deer Run Rd / Green Cedar Ln / Green Hemlock Ln as well as Winona Ln / Rabbit Run Rd

The groundwater source consists of three wells. The wells are located [REDACTED] [REDACTED] [REDACTED]. The water is pumped from the wells by submersible pumps and stored in two storage reservoirs. Total storage is 66,000 gallons. Upon demand the water is distributed through the lines to your home by seven booster pumps and eleven pressure tanks.

***An exciting update for your system:** an emergency backup generator is being installed at the pumphouse in 2020 - this means that during the next power outage, the water pumps will automatically be able to continue to replenish your reservoir (as opposed to having one of our operators have to manually start them), so that you are able to maintain constant access to safe & reliable drinking water!

Can I shut off my own water at the meter?

NO! The water meter box and the valve inside are the property of Cascadia Water. If you shut off the valve in the meter, and it breaks, you are responsible for the cost of the repairs and replacement of the broken valve. You can request that one of our local operators come out to turn it on/off, (with a tariffed fee). As an alternative, many customers have installed their own shut-off valve, usually on the side of their house, that they can turn on/off on their own.

Water Test Results

Total Coliform/E. coli testing: **0** positive sample results in 2019

Substance	MCL	MCLG	Your Water	Violation	Sample Date	Typical Sources of Contaminant in Drinking Water
Arsenic (ppb)	10	0	2 - 7	No	08/19	Erosion of natural deposits <i>Your drinking water currently meets EPA's revised drinking water standard for arsenic. However, it does contain low levels of arsenic. There's a small chance that some people who drink water containing low levels of arsenic for many years could develop circulatory disease, cancer or other health problems. Most types of cancer and circulatory diseases are due to factors other than exposure to arsenic. EPA's standard balances the current understanding of arsenic's health effects against the costs of removing arsenic from drinking water.</i>
Barium (ppm)	2	2	0.027	No	08/19	Erosion of natural deposits
Fluoride (ppm)	4	4	0.10	No	08/19	Erosion of natural deposits; water additive which promotes strong teeth; discharge from fertilizer and aluminum factories

Important Drinking Water Definitions:

MCL	Maximum Contaminant Level - the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.
MCLG	Maximum Contaminant Level Goal - the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.
ppm	ppm: parts per million, or milligrams per liter
ppb	ppb: parts per billion, or micrograms per liter

If you have any questions about this report, the water test results or concerning your water utility, please call (360) 331-7388 and ask for the general manager Culley Lehman.
